CS2100 Computer Organisation Lab #9: Using Logisim I

(For 2022/23 Sem 2 only: This lab is UNGRADED

and no submission is necessary)

Name:	Student No:
Lab Group:	

Objective:

You will learn to use **logisim** to analyse a simple circuit and create a 4-bit parallel adder.

Preparation (before the lab):

1. Download **logisim** from the following website:

http://www.cburch.com/logisim/download.html

Logisim a graphical tool for designing

a graphical tool for designing and simulating logic circuits

Getting Logisim

Logisim should run on any platform supporting Java, version 5 or later.

- Logisim requires Java 5 or later. If you do not already have it on your computer, Java is available from java.sun.com.
- Download Logisim from Logisim's SourceForge.net page. You will three choices of which release to download.
 - · A . jar file runs on any platform, though not necessarily conveniently.
 - o A MacOS .tar.gz file
 - · A Windows .exe file

If you use MacOS or Windows, I would recommend using the release specific to your platform.

- 3. To execute the program:
 - With the generic .jar file: On Windows and MacOS systems, you will likely
 be able to start Logisim by double-clicking the JAR file. If that doesn't work,
 or if you use Linux or Solaris, you can type "java -jar logisim-xx.jar" at
 the command line.
 - With the MacOS X version: Once the downloaded .tar.gz version is uncompressed (this will likely happen automatically), just double-click the Logisim icon to start. You may want to place the icon into the Applications folder.
 - With the Windows version: Just double-click the Logisim icon. You may want to create a shortcut on the desktop and/or in the Start menu to make starting Logisim easier.

If you find Logisim useful, please send me a comment!

SPECIAL INSTRUCTIONS FOR MAC USERS

Logisim will not run properly on MacOS. Please see https://www.techinfoin.com/install-logisim-on-mac/ for how to run Logisim on MacOS. You might also want to try this: https://github.com/laurensk/logisim-macos

2. Run **logisim** and you will see this screen:

3. Click on "Help" → "Tutorial" and read "Beginner's tutorial". Familiarise yourself with the basic working of the software. Go through the 5 steps in the tutorial and create some simple circuits yourself.

Procedure:

1. There is a file called lab9.circ in the ZIP file.

2. Open **lab9.circ** in Logisim. Select the "Poke" tool $\stackrel{\bullet}{\longrightarrow}$ and then click on the inputs X, Y and Z to toggle their values, and observe the changes in the outputs.

3. What is the name of the circuit?

Answer: Full Adder

4. The circuit has two outputs *S* and *C*, but they are not labelled. <u>Add the labels correctly</u>. Show your labTA.

5. Click "Project" → "Analyze Circuit". Click on "Table", and fill in the table below with what you have observed. (If you find that the outputs do not appear in the same column-order as in the table below, you can change the order by clicking on "Outputs".)

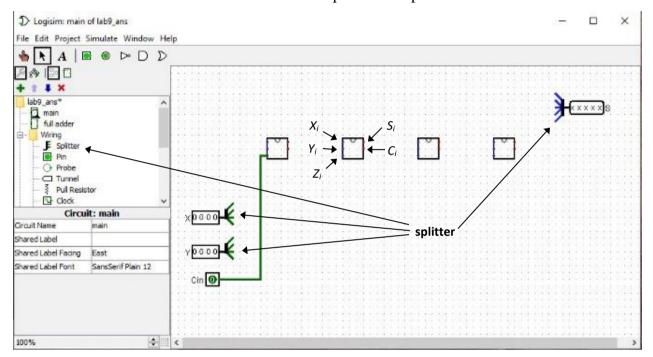

X	Y	Z	C	S
0	0	0	0	0
0	0	1	1	0
0	1	0	1	0
0	1	1	0	1
1	0	0	1	0
1	0	1	0	1
1	1	0	0	1
1	1	1	1	1

6. Still at "Project" \rightarrow "Analyze Circuit". Click on "Minimized". Below the K-map of an output you should see the simplified SOP expressions for that output. Write down the simplified SOP expressions for the two outputs S and C.

 $S = \underline{YZ+XZ+XY}$ C = X'Y'Z+X'YZ'+XY'Z'+XYZ

- 7. Currently, the circuit you have is in the "main" circuit. Now, click on "Project" → "Add circuit...". A pop-up menu will appear asking for the circuit name. Enter the name with the answer you have for part 3 above. This will create a new entry with that name just below "main". Let's refer to this name as xxxx here for the subsequent parts.
- 8. Transfer the circuit you have in "main" (using the select button and click and hold the left mouse button to select the whole circuit, then press **ctrl-x** to cut) and paste it into the newly created "xxxx" circuit (click on "xxxx" making sure the magnifying glass is over it and press **ctrl-v** to paste).

- 9. Go back to the "main" circuit (which should be empty now). Create a **4-bit parallel adder** here by using 4 copies of the xxxx circuit you have created earlier. A partial diagram is shown below.
 - Each xxxx is represented by a block diagram. The labels are indicated in one of the block diagrams below for your reference.
 - The 4-bit inputs X and Y are created by clicking on the input pin button \square and specifying 4 data bits in the attribute table. Likewise, the 5-bit output S is created by clicking on the output pin button \square and specifying 5 data bits in the attribute table.
 - Splitters (refer to the Logisim tutorial, "Wire bundles" → "Splitters" for more details) are used to route the different bits in the inputs and outputs.

(Not applicable for 2022/23 Semester 2)

10. Show the completed 4-bit parallel adder circuit to your lab TA.

Report: 5 marks

Demonstration: Part 4 (2 marks), Part 10 (8 marks)

Total: 15 marks

Your graded report will be returned to you at your next lab.
